

Introduction of the Property Care Association and the Wood Protection Association

Members of BWPDA include those providing remedial timber and damp repair products and services to the public, professional and commercial clients, and those supplying wood preservatives, fire retardants and treated timber to the DIY, professional and industrial sectors. Reflecting these different market areas, the BWPDA has formed two new Divisions for its members: the **Property Care Association** and the **Wood Protection Association**. Companies operating in these divisions remain members of BWPDA but the new structure will focus support for members in the markets they are operating in and will facilitate the delivery of appropriate information and advice to our members' clients, the public and professionals in those markets.

The Property Care Association (a Division of BWPDA)

The Property Care Association is a trade association at the heart of remedial work. Whether it's woodworm, wood rot, damp, wall-tie repairs or structural waterproofing, our contractor members encounter just about every sort of problem in the course of their work. All companies wishing to join the BWPDA and its Property Care Association must meet strict criteria for technical competence, health, safety and environmental protection, management systems and financial stability before they are accepted. Such levels of competence may seem unduly high for the apparently mundane matter of remedial treatment, but money may be wasted if a problem is misdiagnosed - with even further funds at risk in returning to the problem for the right solution. By choosing a member of the Property Care Association (a Division of the BWPDA), you are ensuring the use of a contractor who can provide a professional service with trained and qualified staff and who abides by recognised industry Codes of Practice.

A Division of the BWPDA

The Wood Protection Association (a Division of BWPDA)

The Wood Protection Association encompasses BWPDA members who manufacture and supply preservatives and fire retardants and those who treat timber in industrial treatment plants. Products are manufactured under Quality Assurance procedures, typically BS EN ISO 9000, and treatment of wood is carried out by companies who meet the association's Approved Treater criteria for quality assurance, trained and competent plant operators and health, safety and environmental protection. By sourcing your treated timber requirements from a Wood Protection Association Approved Treater you are dealing with a company that has demonstrated its ability to work to the highest standards and to deliver timber with optimum protection for the use to which it is to be put.
